

### **Lecture 5: Central Tendency and Dispersion-II**

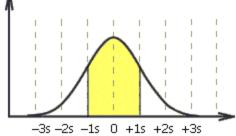

#### Dr. A. Ramesh

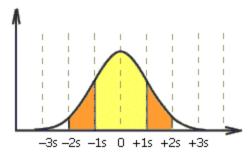

**Department of Management Studies** 

# The Empirical Rule... If the histogram is bell shaped

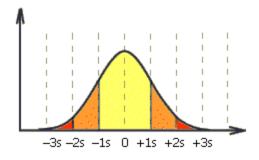

• Approximately 68% of all observations fall within **one** standard deviation of the mean.

 Approximately 95% of all observations fall within **two** standard deviations of the mean.

 Approximately 99.7% of all observations fall within **three** standard deviations of the mean.

# **Empirical Rule**

Data are normally distributed (or approximately normal)

| Distance from the Mean | Percentage of Values Falling Within Distance |  |  |
|------------------------|--|--|--|
| $\mu \pm 1\sigma$      | 68   |  |  |
| $\mu \pm 2 \sigma$     | 95   |  |  |
| $\mu \pm 3\sigma$      | 99.7   |  |  |

# Chebysheff's Theorem...Not often used because interval is very wide.

- A more general interpretation of the standard deviation is derived from *Chebysheff's Theorem*, which applies to all shapes of histograms (not just bell shaped).
- The proportion of observations in any sample that lie within **k** standard deviations of the mean is at least:

$$1 - \frac{1}{k^2}$$
 for  $k > 1$ 

For k=2 (say), the theorem states that at least 3/4 of all observations lie within 2 standard deviations of the mean. This is a "lower bound" compared to Empirical Rule's approximation (95%).

## **Coefficient of Variation**

- Ratio of the standard deviation to the mean, expressed as a percentage
- Measurement of <u>relative</u> dispersion

$$C.V. = \frac{\sigma}{\mu} (100)$$

## **Coefficient of Variation**

$$\mu_{1} = 29$$

$$\sigma_{1} = 4.6$$

$$C.V._{1} = \frac{\sigma_{1}}{\mu_{1}}(100)$$

$$= \frac{4.6}{29}(100)$$

$$= 15.86$$

$$\mu_{2} = 84$$

$$\sigma_{2} = 10$$

$$C.V_{2} = \frac{\sigma_{2}}{\mu_{2}} (100)$$

$$= \frac{10}{84} (100)$$

$$= 11.90$$

# Variance and Standard Deviation of Grouped Data

Population

Sample

$$\sigma^{2} = \frac{\sum f\left(M - \mu\right)^{2}}{N}$$

$$\sigma = \sqrt{\sigma^{2}}$$

$$S^{2} = \frac{\sum f(M - \overline{X})^{2}}{n-1}$$

$$S = \sqrt{S^{2}}$$

# Population Variance and Standard Deviation of Grouped Data(mu=43)

| Class Interval | f  | M  | fM        | М-μ | $(M-\mu)^2$ | $f\left(M-\mu\right)^2$ |
|----------------|----|----|-----------|-----|-------------|-------------------------|
| 20-under 30    | 6  | 25 | 150       | -18 | 324         | 1944                    |
| 30-under 40    | 18 | 35 | 630       | -8  | 64          | 1152                    |
| 40-under 50    | 11 | 45 | 495       | 2   | 4           | 44                      |
| 50-under 60    | 11 | 55 | 605       | 12  | 144         | 1584                    |
| 60-under 70    | 3  | 65 | 195       | 22  | 484         | 1452                    |
| 70-under 80    | 1  | 75 | <u>75</u> | 32  | 1024        | <u>1024</u>             |
|                | 50 |    | 2150      |     |             | 7200                    |

$$\sigma^{2} = \frac{\sum f(M - \mu)^{2}}{N} = \frac{7200}{50} = 144$$

# **Measures of Shape**

#### Skewness

- Absence of symmetry
- Extreme values in one side of a distribution

#### Kurtosis

Peakedness of a distribution

- Leptokurtic: high and thin
- Mesokurtic: normal shape
- Platykurtic: flat and spread out

#### Box and Whisker Plots

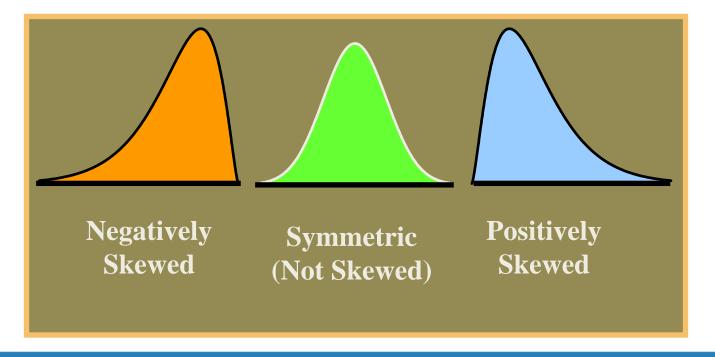

- Graphic display of a distribution
- Reveals skewness

# **Skewness**

## Skewness...

The *skewness* of a distribution is measured by comparing the relative positions of the mean, median and mode.

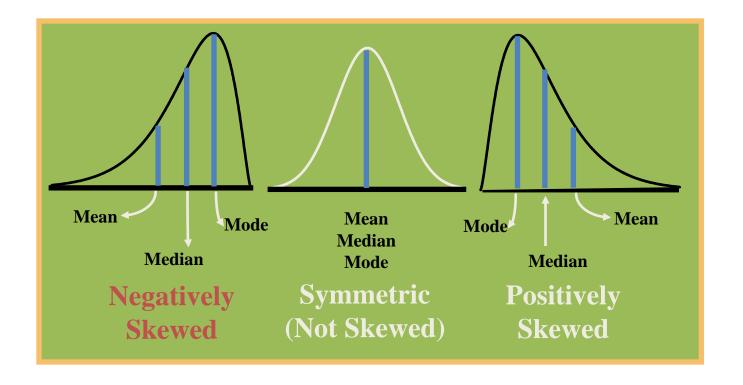

- Distribution is symmetrical
  - Mean = Median = Mode
- Distribution skewed right
  - Median lies between mode and mean, and mode is less than mean
- Distribution skewed left
  - Median lies between mode and mean, and mode is greater than mean

## **Skewness**

## **Coefficient of Skewness**

Summary measure for skewness

$$S = \frac{3(\mu - M_d)}{\sigma}$$

- If S < 0, the distribution is <u>negatively skewed</u> (skewed to the left)
- If S = 0, the distribution is <u>symmetric</u> (not skewed)
- If S > 0, the distribution is <u>positively skewed</u> (skewed to the right)

## **Coefficient of Skewness**

$$\mu_{1} = 23 
M_{d_{1}} = 26 
M_{d_{2}} = 26 
\sigma_{1} = 12.3 
S_{1} = \frac{3(\mu_{1} - M_{d_{1}})}{\sigma_{1}} 
= \frac{3(23 - 26)}{12.3} 
= -0.73$$

$$\mu_{2} = 26 
M_{d_{3}} = 26 
\sigma_{3} = 12.3 
\sigma_{3} = 12.3 
S_{2} = \frac{3(\mu_{2} - M_{d_{2}})}{\sigma_{2}} 
S_{3} = \frac{3(\mu_{3} - M_{d_{3}})}{\sigma_{3}} 
= \frac{3(29 - 26)}{12.3} 
= +0.73$$

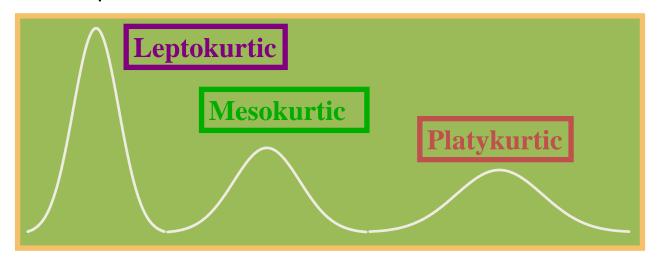

## **Kurtosis**

- Peakedness of a distribution
  - Leptokurtic: high and thin
  - Mesokurtic: normal in shape
  - Platykurtic: flat and spread out

## **Box and Whisker Plot**

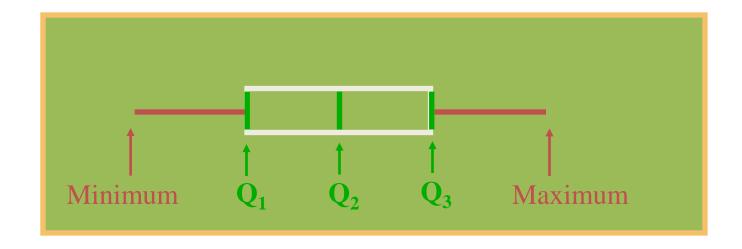

- Five specific values are used:
  - Median, Q<sub>2</sub>
  - First quartile, Q<sub>1</sub>
  - Third quartile, Q<sub>3</sub>
  - Minimum value in the data set
  - Maximum value in the data set
